

C BranchNode

□ children : List<Node>

- getChildCount() : int
- getChildren() : List<Node>
- insert(child: Node, index: int) : void
- isLeaf() : boolean

It can manage children. It must be re-instantiated from a LeafNode if a child is added. Adds complexity

It manages leaf nodes only. It does not provide methods for adding/deleting children

C LeafNode

● isLeaf() : boolean
