

Alternative without Builder: mutable dependency object

creates and mutates

-elements : List<Element>
-attributeList : List<Integer>

+Dependencies(elements : List<Element>, attributeList : List<Integer>, isNodeContained : boolean)
+setElements(elements : List<Element>) : void
+setAttributeList(attributeList : List<Integer>) : void
+setNodeContained(contained : boolean) : void

Without a Builder, the object would need a large constructor or public setters.

This can lead to incomplete or unsafe states, especially when the object is shared.
